

DAY 2 : ASSIGNMENT – 02

CHALLENGE QUESTION

Write a python program to sort the list of heterogenous data for

e.g `L=["Ram",1,"Shyam",2,"Aman"]`

`print (L) , L.sort() , print(L)`. above code gives error . Correct it

solution:

The error in the given code arises because the `sort()` method cannot handle heterogeneous lists containing both strings and integers. Python cannot compare different data types directly during sorting.

```
L = ["Ram", 1, "Shyam", 2, "Aman", 3]
```

```
strings = [x for x in L if isinstance(x, str)]
```

```
numbers = [x for x in L if isinstance(x, int)]
```

```
strings.sort()
```

```
numbers.sort()
```

```
sorted_list = strings + numbers
```

```
print("Original list:", L)
```

```
print("Sorted list:", sorted_list)
```

Output :

```
Original list: ['Ram', 1, 'Shyam', 2, 'Aman', 3]
```

```
Sorted list: ['Aman', 'Ram', 'Shyam', 1, 2, 3]
```
